

## **MEC 316 - Instrumentation and Solid Mechanics Laboratory**

**Syllabus by Fu-Pen Chiang**

---

### **Course Description:**

The aim of this course is to teach students instrumentation and techniques that are pertinent to perform experiments in solids as they respond to external static/dynamic loads. Students are to learn and witness different modes of material/structural failure such as yielding, ultimate stress, material fatigue, structural instability, vibration and stress concentration. Another aim is to perform experiments to check the validity (and the lack of) of the beam theory described in MEC 363(Solid Mechanics). Experiments will be performed to show the existence of neutral axis in a beam under bending, the visualization and calculation of stress concentration due to the existence of a circular hole under tension. Students form groups of 3 to 4 who are collectively responsible for the lab projects. Lectures at the beginning of the course provide background information and theories of experimentation. Not to be taken in the same semester with MEC 317. This course has an associated fee. Please see [www.stonybrook.edu/coursefees](http://www.stonybrook.edu/coursefees) for more information.

Prerequisites: MEC major; C or better in MEC 363; PHY 134 Corequisites: MEC 220; MEC 300; AMS 361 or MAT 303
